

Innovation / Additional Functionality

The following improvements were added to the project:

1. Configuration File

Database credentials were separated into a config.py file to improve portability and simplify Virtual Machine (VM) deployment and testing.

2. Global Database Connections

MySQL and Neo4j connections were created globally to reduce repeated connection code and improve application structure.

3. Requirements File

A requirements.txt file was added to simplify package installation on the VM environment.

4. Room Caching

Room data is cached after the first database query so that newly added rooms are not displayed until the application restarts, matching the project specification.
